

Replication Materials, **MCBS Data Component**, for
WHY DO COUPLES AND SINGLES SAVE DURING RETIREMENT? HOUSEHOLD HETEROGENEITY AND ITS AGGREGATE IMPLICATIONS

by Mariacristina De Nardi, Eric French, John Bailey Jones and Rory McGee
JPE MS 2021-11-29

February 2024

Overview: This file describes how we obtained and processed the MCBS data.

Data Access: The MCBS data we used are not publicly available and thus not provided here. We used the “*cost_and_use*” data, which were hosted on the NBER UNIX servers.

Programs: Below we describe the programs that use MCBS data to impute Medicaid spending for the HRS. The programs reside in
/Programs and Data/wealthcouples/impute/MCBS_imputation_code.

1. **Directory: .../research/clean**

a. **clean/YYYY.do:**

YYYY is every year from 1996 to 2012

Inputs: Raw MCBS data files from /disk/agedisk2/mcbs/cost_and_use/data/.

Outputs: YYYY.dta

2. **Directory: .../research/merge**

a. **Merge.do:**

Main file (merged clean files), with no price deflation

Appends clean/1996/1996.dta-clean/2012/2012.dta

Output: /research/merge/merge.dta

List of variables in merge.dta:

- baseid
- weights: population weights
- year
- pce: 2005 base
- male
- age
- dead
- heal: health status, 1 if bad, 0 if good
- married
- nurshome: = 1 if in a nursing home for 60 days or more
- nurshomedays: days spent in a nursing home

- medicaidind: MCBS administrative variable = 1 if individual participates in Medicaid. Note that this variable excludes a number of individuals for whom Medicaid payments is positive.
- workdind: = 1 if individual works. this variable is missing for 1996-98
- income
- totalexp: total expenditures
- oop: costs paid out of pocket
- medicare: reimbursements from Medicare
- medicaid: reimbursements from Medicaid
- privins: reimbursements from private insurance (Medigap, etc...)
- otherexp: reimbursements from other sources
- secondaryinsprem: premia paid to non-Medicare sources
- partapremium: Medicare Part A premium
- partbpremium: Medicare Part B premium
- totpremium: sum of secondaryinsprem, partapremium, partbpremium
- ooppluspremium: sum of totpremium and oop

b. [gen_mergecouples.do](#):

Uses merge.dta. Deflates all nominal quantities to 2014 dollars. Also computes the Medicaid premium variable and an indicator for Medicaid receipt.

Inputs: merge/merge.dta

Output: mergecouples.dta. Note: in "merge" prices are nominal, and in "mergescouples" they are deflated to 2014 dollars.

c. [Impute_mcbs.do](#):

Creates HRS consistent variables. Estimates regression coefficients for conditional mean matching imputation. Output files contain the coefficient vector from this regression and a separate file with the residual and value of the $x \cdot \beta$ prediction. Imputation coefficients and residuals are estimated for Medicaid payments as well as for the total medical expenses of Medicaid recipients. Aggregates data to a two-year frequency and estimates the same regressions.

Input: mergescouples.dta

Output: impute_coeffs.dta, impute_donor.dta impute_coeffs2yr.dta, impute_donor2yr.dta, impute_totalexp_coeffs.dta, impute_totalexp_donor.dta impute_totalexp_coeffs2yr.dta, impute_totalexp_donor2yr.dta.

Note: files ending with "coeffs" contain a vector of coefficients. Files ending with "donor" contain the value of the residuals and the $x\beta$ prediction. Files with "totalexp" contain total expenditures=Medicaid+medicare+OOP and files with "2yr" have biennial data.

3. Please contact us if something is unclear, so that we can improve the documentation, and make it clearer for everyone.
